

RAINWATER HARVESTING

A GOOD PRACTICE FOR CLIMATE CHANGE ADAPTATION

Water is a vital resource

The problem

Due to Climate Change the rainfall regime has changed

We had the proof that even in our rainy territory water scarcity can be a serious issue

During summer 2022 our territory suffered an extreme drought

Sott'acqua

I fiumi rompono gli argini in Emilia-Romagna: 9 morti, oltre 10 mila sfollati. Bonaccini: come un terremoto Dall'Appennino alla costa molti paesi isolati dalle frane e dagli allagamenti. Annullato il Gp di Imola
Piogge tropicali sull'Adriatico: è l'effetto del clima malato

The problem pt.2

Water abundance in the past led us to manage it in an extractive way, considering it an eternally renewable resource.

When there's too much water (during rainfall) we let it flow away

When there's too little we take it from outside

What should we
do (at a local
scale)?

We should manage rainwater

From a degenerative

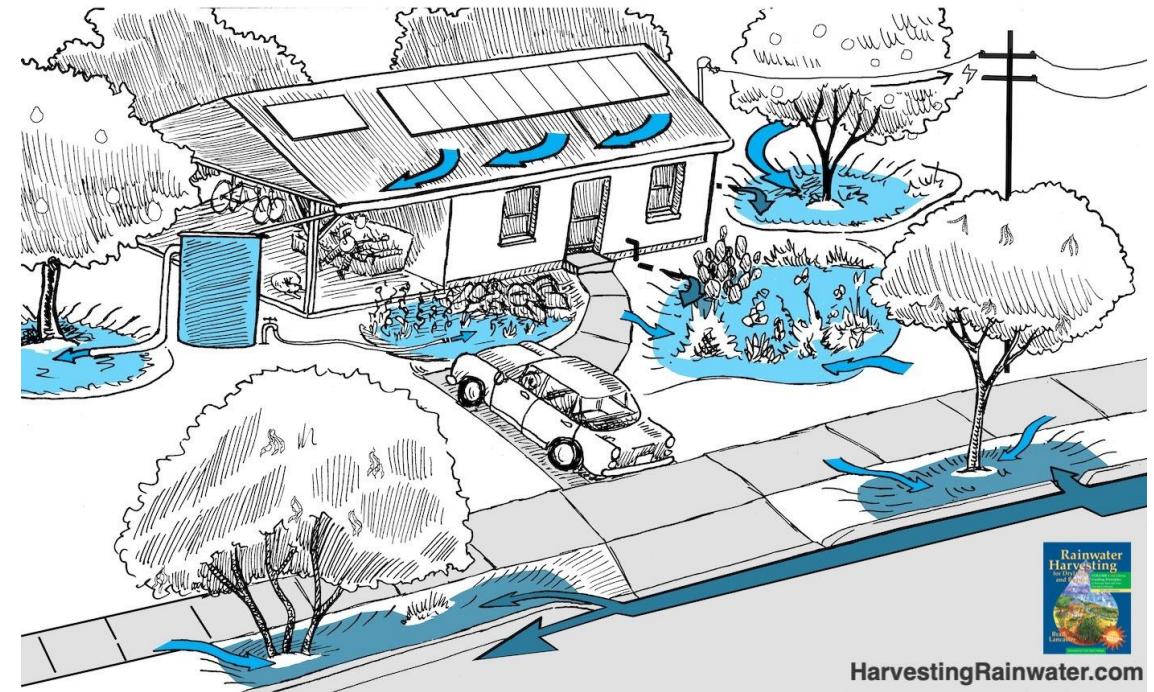

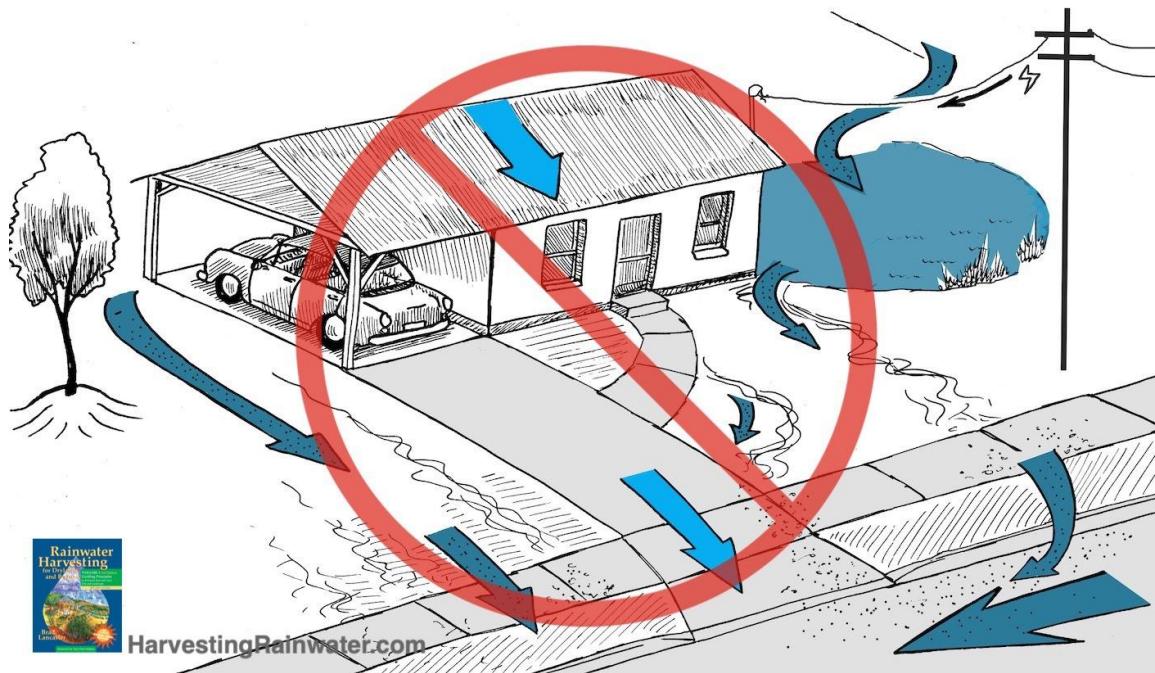

to a **regenerative** approach

The solution: rainwater harvesting

Transform our property into a sponge to collect water

We need to think of our garden/terrace as if it were a watershed

How to?

Free your
imagination... and
your ability

The benefits
